This specification is and remains the property of BCMM, produced for its own purposes. It is a policy of BCMM that standardised specifications, standards and other standardised documents of a non-confidential nature, such as this, may be made available to third parties for their use, on application, under the following conditions:

1. The use, application, or interpretation of the material is entirely at the applicant's own risk and neither the applicant nor anybody else shall have any claim against BCMM arising out of the use of the material.
2. BCMM is under no obligation to advise the applicant of and supply later versions of the material.
3. BCMM retains the right to refuse the supply of further material without incurring liability for loss or damage in the event of such refusal.
4. BCMM reserves the right to modify and change the material as and when it sees fit.
5. The material is and remains the property of BCMM, who has the exclusive right of dissemination and reproduction thereof.
6. The material is protected by copyright and the applicant may not reproduce or transmit the material by any means except with the prior consent of BCMM in writing.
7. Applicants may not exploit this material for financial gain.
8. No rights of ownership in the material or licence to the applicant shall be deemed to pass with the supply of material to the applicant.
9. Except as may be provided for in a separate agreement, BCMM shall not be obliged by virtue of the supply of the material, to advise, interpret, analyse or otherwise give input on the material to the applicant or any other person.
10. BCMM reserves the right to recover costs.

INTRODUCTION

WHAT IS LOAD SHEDDING?

- When there is not enough electricity available to meet the demand from all Eskom or Municipal customers, it could be necessary to interrupt supply to certain areas. This is called load shedding. It is different from a power outage that could occur for several other reasons.
- It is a last resort to balance electricity supply and demand. Load shedding will only apply when all other options have been exhausted.
- It is an effective way to avoid total collapse of the electricity supply grid (a national black-out) which will have disastrous outcomes for South Africa. If unbalances on the power is not managed this could lead to the risk of collapse of the entire power network. If this occurs, it could take more than a week to restore power to the entire country. By rotating and shedding the load in a planned and controlled manner, the system remains stable.
- Before load-shedding is applied, Eskom makes use of:
 - Gas and hydro options
 - Contracted and voluntary options with certain large customers to reduce their demand.
 - If all these measures have been exhausted and demand still cannot be met, Eskom will proceed with load-shedding.

THE LOAD SHEDDING PROCESS

- Eskom's National Control Centre instructs its Distribution Regional Control Centres, 126 Municipalities and Eskom's key Industrial Customers on the Megawatts to be shed.
- Eskom (Regional Distributor) and Municipalities execute these instructions by switching off individual areas for predetermined times as per published schedules.
- The duration of load-shedding will depend on the specific Eskom region or on the Municipality; based on local circumstances.

LOAD SHEDDING ONLY AS A LAST RESORT

- Eskom must continue with the planned maintenance of our Generation plant during this winter. This will enable a sustainable Generation plant going forward.
- This means that the national power system will be particularly strained during the evening peak between 5pm and 9pm in winter, and during any time of the day in the summer months.

NRS 048-09

A new Government standard that has been implemented in order to organise the manner by which load shedding is implemented during periods of supply capacity problems and the handling of critical loads.

CRITICAL LOADS

Load that is as far as possible protected from the impact of load shedding or loss of supply in order to either maintain the operational integrity of the power system, or to avoid a cascading impact on public infrastructure.

LOAD SHEDDING STAGES

In order to safeguard the Electrical Network the implementation of NRS 048-09 is imperative. In order to implement this standard - stages have been introduced based on the strain on the national grid to supply capacity.

STAGE 1

This stage is initiated if the reduction is not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 6.25% of the load profile of BCMM will be required to be shed for a period of 2 ½ hours.

STAGE 2

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 12.5% of the load profile of BCMM will be required to be shed for a period of 2 ½ hours.

STAGE 3

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 18.75% of the load profile of BCMM will be required to be shed for a period of 2 ½ hours.

STAGE 4

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 25% of the load profile of BCMM will be required to be shed for a period of 2 ½ hours.

STAGE 5

This stage is initiated if the reduction is not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 31.25% of the load profile of BCMM will be required to be shed for a period of 2 ½ hours.

STAGE 6

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 37.5% of the load profile of BCMM will be required to be shed for a period of 2 ½ hours.

STAGE 7

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 43.75% of the load profile of BCMM will be required to be shed for a period of 2 ½ hours.

STAGE 8

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 50% of the load profile of BCMM will be required to be shed for a period of 4 ½ hours.

STAGE 9

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 56.25% of the load profile of BCMM will be required to be shed for a period of 4 ½ hours.

STAGE 10

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 62.5% of the load profile of BCMM will be required to be shed for a period of 4 ½ hours.

STAGE 11

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 68.75% of the load profile of BCMM will be required to be shed for a period of 4 ½ hours.

STAGE 12

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 75% of the load profile of BCMM will be required to be shed for a period of 4 ½ hours.

STAGE 13

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 81.25% of the load profile of BCMM will be required to be shed for a period of 6 ½ hours.

STAGE 14

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 87.5% of the load profile of BCMM will be required to be shed for a period of 6 ½ hours.

STAGE 15

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 93.75% of the load profile of BCMM will be required to be shed for a period of 6 ½ hours.

STAGE 16

This stage is initiated if the reduction is still not sufficient to safeguard the National Grid, this is Scheduled Load Scheduling whereby 100% of the load profile of BCMM will be required to be shed for a period of 32 hours.

BLOCK SYSTEM

Load shedding within BCMM works on a rolling block timetable. The various towns, suburbs and streets have been assigned to various blocks, from blocks **1 to 16**. Each block is allocated a time slot to undergo load shedding over a 31-day period. Please refer to the Block Allocations on page 11 to determine which block your city / suburb / area / street falls under.
